

MEMORANDUM

TO: John Mitnik, Bureau Chief, Engineering and Construction
THROUGH: Dean Powell, Bureau Chief, Water Supply
FROM: SFWMD Staff Water Supply Advisory Team
DATE: July 7th, 2015
SUBJECT: Water Supply Report

District-wide Conditions

Groundwater levels showed mixed trends throughout most of the District over the last week. The United States Geological Survey (USGS) real-time wells in the Kissimmee Basin (KB) within the District boundaries were in the median percentile range for this time of year. The majority of surface and groundwater stations in the KB recorded increases in water levels over the last seven days. Stages in the Upper East Coast (UEC) canals C-23, C-24, and C-25 were at 22.69, 19.59, and 20.70 feet, respectively, well above the 14 feet NGVD agricultural cutoff level. Approximately two thirds of the UEC surficial aquifer wells were in the lower 10th to 30th percentile range or lower for this time of year. Surface and groundwater levels decreased in about half of the stations in the Biscayne aquifer over the last week. Approximately two-thirds of USGS monitor wells in Miami Dade County are in the lower 10th percentile range for this time of year. Low water levels persist in Everglades National Park (ENP), the WCAs (Water Conservations Areas), and in C-111.

In the Lower West Coast (LWC), groundwater levels increased in the majority of the monitoring stations over the last seven days. About seventy percent of the wells in the Surficial aquifer are at median levels, with the remainder in the lower 10th to 30th percentile range. About two thirds of the wells in the Lower Tamiami aquifer are at median levels for this time of year. Approximately seventy percent of the Sandstone aquifer wells are at median levels, with the remainder in the lower 10th to 30th percentile range or lower. The majority of the Mid-Hawthorn aquifer wells are in the median percentile range or higher. A few sites in coastal Lee County are in the lower 10th to 30th percentile range or lower. **Figure 1** is a USGS map showing conditions on July 6th, 2015, from a 7-day running average of daily recorded water levels compared to the statistical distribution of daily water levels for the period of record for selected sites in southern Florida.

PROVISIONAL DRAFT -- Subject to Revision

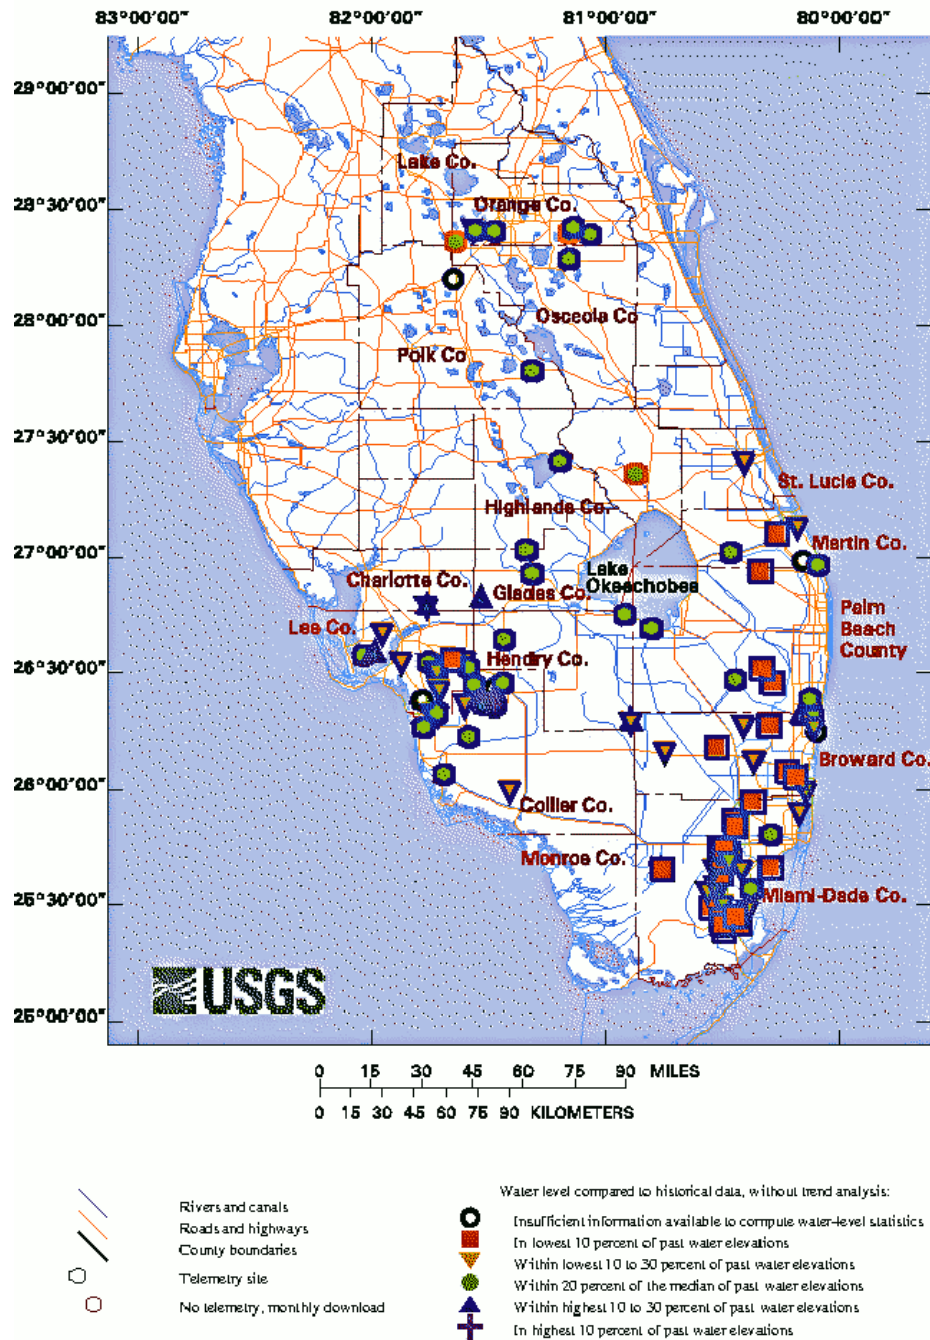

Figure 1. Current Water-level Conditions in South Florida (source: USGS, http://www.sflorida.er.usgs.gov/ddn_data/index_ndt.html)

Water Supply Technical Input to LORS2008

The Palmer Index for Lake Okeechobee (LOK) Tributary Conditions is -2.07, classified as “extremely dry,” and is in the “high” risk category. The LOK stage for the next two months is projected to be in the Base Flow Sub-Band, and the risk to water supply is categorized as “moderate.” The Climate Prediction Center’s (CPC) Precipitation Outlook is projected as “normal” for one month and “normal” for three months, leaving both the one month and three month outlooks at “low” risk. The LOK Seasonal Net Inflow Forecast is in the “normal to extremely wet” range, with “low” risk to water supply. The Multi-Seasonal Net Inflow Forecast is projected as “wet,” with “low” risk to water supply. Stages in Water Conservation Areas 1 and 3A are between line 1 and line 2 this week, in the “moderate” risk category. Water Conservation Area 2A is below line 2 and is in the “high” risk category. Groundwater levels in Service Areas 1 are in the “low” risk category. Service Areas 2 is in the “moderate” risk category, and Service Area 3 is in the “high” risk category. The Year-Round Irrigation Rule is in effect for the LEC Service Areas. **Figure 2** summarizes the water supply risk indicators.

LORS2008 Implementation on 7/6/2015 (ENSO Neutral Condition):

Water Supply Department Technical Input

Water Supply Outlook:

District wide, Raindar rainfall 1.62 inches for the week ending 7/6/2015. Lake stage on 7/6/2015 is 12.11 ft, down 0.13 ft from last week.

The updated June 2015 SFWMM Dynamic Position Analysis [percentile graph](#) and [tracking chart](#) for Lake Okeechobee show that the lake stage is in the Low Flow Operational Sub-Band.

The LORS2008 tributary [indices](#) are classified as **Dry**. The PDSI indicates dry condition and the LONIN is Dry. The classification is based on the wetter of the two.

Water Supply Risk Evaluation

Area	Indicator	Value	Color Coded Scoring Scheme
LOK	Projected LOK Stage for the next two months	Base Flow Sub-Band	M
	Palmer Index for LOK Tributary Conditions	-2.07 (Extremely Dry)	H
	CPC Precipitation Outlook	1 month: Normal	L
		3 months: Normal	L
	LOK Seasonal Net Inflow Forecast	2.64 ft (Normal to Extremely Wet)	L
	AMO warm/El Nino		
	LOK Multi-Seasonal Net Inflow Forecast	4.37 ft (Wet)	L
	AMO warm/El Nino		
WCAs	WCA 1: Site 1-7, Site 1-8T, & Site 1-9 Average	Between Line 1 & 2 (14.59 ft)	M
	WCA 2A: Site 2-17 HW	Below Line 2 (10.31 ft)	H
	WCA-3A: 3 Station Average (Site 63, 64 and 65)	Between Line 1 & 2 (8.71 ft)	M
LEC	Service Area 1	Year-Round Irrigation Rule in effect	L
	Service Area 2	50% or more of USGS wells are within the lowest 10% to 30% of past water elevations and not more than 25% are in the lowest 10% of past water elevations	M
	Service Area 3	50% or more of USGS wells are within the lowest 10% to 30% of past water elevations and more than 25% are in the lowest 10% of past water elevations	H

Note: The water supply risk classification based on the Palmer index, as well as the LOK seasonal and multi-seasonal net inflow forecasts use slightly different classification intervals than those used by the 2008-LORS for classifying the tributary hydrologic condition (THC).
